

Router Collet Extensions

Give your router bit additional height! Router Collet Extensions are an inexpensive way for bits that are too short for the job.

Collet Extensions are often used on table mounted routers when coping sleds are needed.

They are also needed when routing deep profiles for custom mouldings and serving tray projects.

In all these situations, the router bit needs to extend from the router more than the standard router collet allows.

Both of these extensions are for use in a router with a 1/2" collet.

The smaller extension (#14112) accepts a 1/4" shank router bit and extends the collet by 2".

The larger extension (#14113) accepts a 1/2" shank router bit and extends the collet by 2-1/4"

Both collets are made using stress-proof steel and both are precision made.

Your next project just got easier!
